

Blade tutorial. © Robin Chen

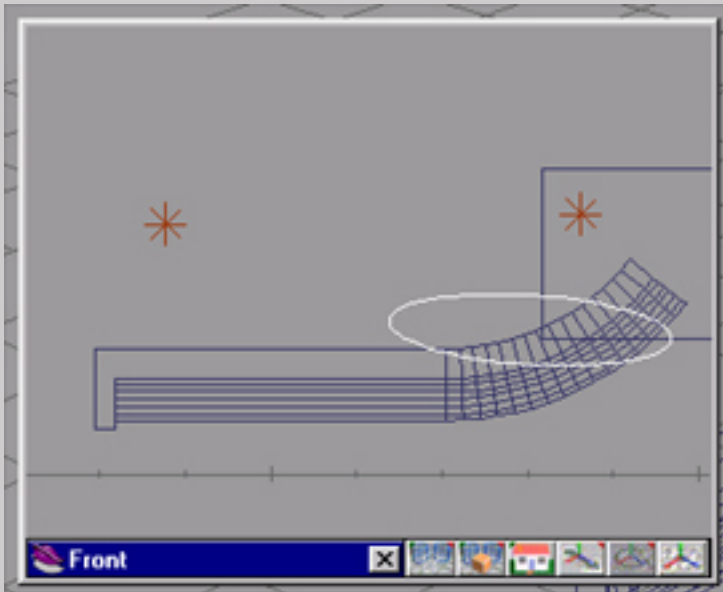

First position a box and 2 cylinders in the following arrangement. Make sure that the cylinders intersect for easier subtraction.

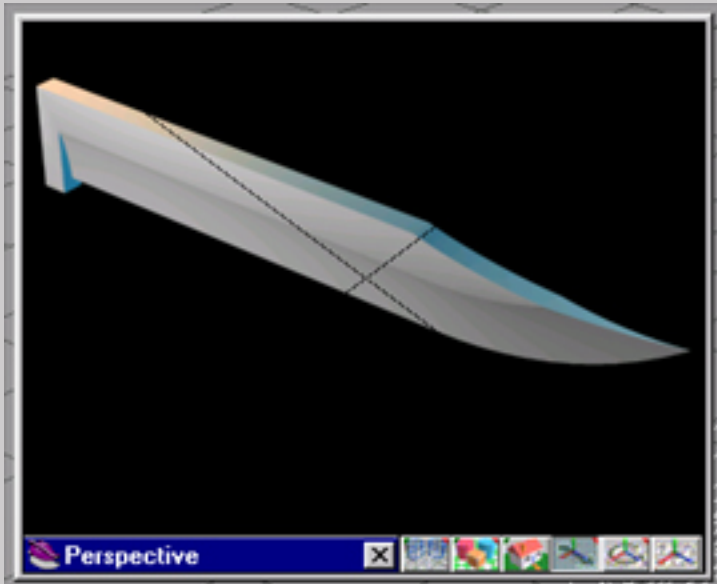

Second, do the subtraction, then lathe the head of blade.

Third, cut off the extra lathing with a cylinder and box.

Then, you're done!

When you paint a blade, paint it first with phong shading, then use the Paint Face tool to paint the flat shiny part of the blade (polished sides of the blade) with metal shading.
